	Warning!	Today.
CS70: Countability and Uncountability Alex Psomas June 30, 2016	Warning: I'm really loud!	One idea, from around 130 years ago. At the heart of set theory. Started a crisis in mathematics in the middle of the previous century!!!! The man who worked on this was described as: • Genious? • Renegade? • Corrupter of youth? • The King in the North?
The idea.	Life before Cantor	Cantor's questions
The idea: More than one infinities!!!!!! The man:	 How many elements in {1,2,4}? 3 How many elements in {1,2,4,10,13,18}? 6 How many primes? Infinite! How many elements in N? Infinite! How many elements in N \{0}? Infinite! How many elements in Z? Infinite! How many elements in R? Infinite! What is this infinity though? The symbol you write after taking a limit Don't think about it Even Gauss: "I protest against the use of infinite magnitude as something completed, which is never permissible in mathematics. Infinity is merely a way of speaking, the true meaning being a limit which certain ratios approach indefinitely close, while others are permitted to increase without restriction. " 	Is $\mathbb{N} \setminus \{0\}$ smaller than \mathbb{N} ? Is \mathbb{N} smaller than \mathbb{Z} ? What about \mathbb{Z}^2 ? Is \mathbb{N} smaller than \mathbb{R} ?

Countable.

- Enumerable means countable.
- Subsets of countable sets are countable.
 For example the set {14,54,5332,10¹²+4} is countable. (It has 4 elements) Even numbers are countable. Prime numbers are countable. Multiples of 3 are countable.
- All countably infinite sets have the same cardinality as each other.

Examples: Countable by enumeration

▶ $\mathbb{N} \times \mathbb{N}$ - Pairs of integers. Square of countably infinite? Enumerate: (0,0), (0,1), (0,2),...??? Never get to (1,1)! Enumerate: (0,0), (1,0), (0,1), (2,0), (1,1), (0,2)... (dovetailing) (0,0) → (0,1) (0,2) → (0,3) (1,0) (1,1) (1,2) → (0,3) (1,0) (1,1) (1,2) → (0,3) (2,0) (2,1) → (0,3) (3,0) → (2,1) → (1,2) (3,0) → (1,1) (1,2) → (1,2) → (1,2)

Back to Hilbert's hotel

Where's the function?

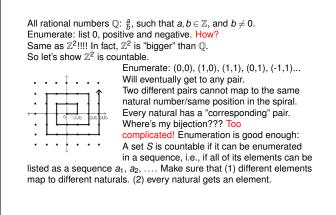

We want a bijection from: $\mathbb{N} \setminus \{0\}$ to \mathbb{N} .

f(x) = x - 1. Maps every number from $\mathbb{N} \setminus \{0\}$ to a number in \mathbb{N} , and every number in $x \in \mathbb{N}$ has exactly one number $y \in \mathbb{N} \setminus \{0\}$ such that f(y) = x.

What if we had a bijection from \mathbb{N} to $\mathbb{N} \setminus \{0\}$?

Same thing! Bijection means that the sets have the same size. Invert it and you'll get a bijection from $\mathbb{N} \setminus \{0\}$ to \mathbb{N} .

Rationals

Let's get real	Diagonalization.	All reals?
Is the set of Reals countable? Lets consider the reals $[0,1]$. Each real has a decimal representation. .50000000 (1/2) .785398162 $\pi/4$.367879441 1/ <i>e</i> .632120558 1 – 1/ <i>e</i> .345212312 Some real number	If countable, there exists a listing (enumeration), L contains all reals in [0,1]. For example 0: .50000000 1: .785398162 2: .367879441 3: .632120558 4: .345212312 : Construct "diagonal" number: .77677 Diagonal Number: Digit <i>i</i> is 7 if number <i>i</i> 's <i>i</i> th digit is not 7 and 6 otherwise. Diagonal number for a list differs from every number in list! Diagonal number not in list. Diagonal number is real. Contradiction! Subset [0, 1] is not countable!!	Subset [0, 1] is not countable!! What about all reals? Uncountable. Any subset of a countable set is countable. If reals are countable then so is [0,1].
Diagonalization.	Another diagonalization. The set of all subsets of N. Example subsets of N: {0}, {0,,7}, evens, odds, primes, multiples of 10	Another diagonalization. $s_1 = 00000000000\dots$ $s_2 = 1111111111\dots$
1. Assume that a set <i>S</i> can be enumerated.	Assume is countable.	$s_3 = 0 \ 1 \ 0 \ 0$
2. Consider an arbitrary list of all the elements of S.	► There is a listing, <i>L</i> , that contains all subsets of <i>N</i> .	$s_4 = 1\ 0\ 1\ 0\ 1\ 0\ 1\ 0\ 1\ 0\ 1\ 0\ 1\ \dots$ $s_5 = 1\ 1\ 0\ 1\ 0\ 1\ 0\ 1\ 0\ 1\ 0\ 1\ \dots$
3. Use the diagonal from the list to construct a new element t .	▶ Define a diagonal set, <i>D</i> : If <i>i</i> th set in <i>L</i> does not contain <i>i</i> , $i \in D$.	$s_6 = 0\ 0\ 1\ 1\ 0\ 1\ 1\ 0\ 1\ 1\ 0$ $s_7 = 1\ 0\ 0\ 0\ 1\ 0\ 0\ 1\ 0\ 0$
 Show that t is different from all elements in the list ⇒ t is not in the list. 	otherwise $i \notin D$.	$s_7 = 100010001000000000000000000000000000$
5. Show that <i>t</i> is in <i>S</i> .	 D is different from <i>i</i>th set in L for every <i>i</i>. D is not in the listing. 	$s_9 = 1 \ 1 \ 0 \ 0 \ 1 \ 1 \ 0 \ 0 \ 1 \ 0 \ \dots$ $s_{10} = 1 \ 1 \ 0 \ 1 \ 1 \ 0 \ 0 \ 1 \ 0 \ \dots$
6. Contradiction.	D is not in the isting. $ D is a subset of N.$	$s_{11} = 1\ 1\ 0\ 1\ 0\ 1\ 0\ 0\ 1\ 0\ 0$
	 L does not contain all subsets of N. 	· · · · · · · · · · · · · · · · · · ·
	Contradiction.	s = 10111010011
	Theorem: The set of all subsets of <i>N</i> is not countable. (The set of all subsets of <i>S</i> , is the powerset of <i>N</i> .)	

Countable or uncountable??

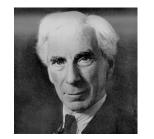

Binary strings?

- Trees?
- Weighted trees?
- Inputs to the stable marriage algorithm?
- Mathematical proofs?
- Programs in Java?
- All possible endings to Game of Thrones?
- All subsets of Reals?
- Functions from \mathbb{N} to \mathbb{N} ?

You already know some of these..... Think about induction!

A bug

Bertrand Russell finds a bug!

Frege's reaction: "Hardly anything more unfortunate can befall a scientific writer than to have one of the foundations of his edifice shaken after the work is finished. This was the position I was placed in by a letter of Mr. Bertrand Russell, just when the printing of this volume was nearing its completion."

What happened with Cantor?

Cantor's work between 1874 and 1884 is the origin of set theory. No one had realized that set theory had any nontrivial content. Before Cantor: Finite , Infinite After Cantor:

- Countable
 - Finite and countable. For example {1,2,3}
 - ▶ Infinite and countable. For example $\mathbb{N}, \mathbb{Z}, ...$
- ► Uncountable. For example [0,1], ℝ...
- ▶ Bigger than uncountable! (Math 135, Math 136, Math 227A ...)

Everyone was upset! Many puzzled... Many openly hostile to Cantor... Cantor was clinically depressed. In and out of hospitals until the end of his life. Died in poverty...

A poem

Zisimos Lorentzatos.

"Beware of systems grandiose, of mathematically strict causalities as you're trying, stone by stone, to found the goldenwoven tower of the logical, castle and fort immune to contradiction. Designed in two volumes, the foundational laws of arithmetic, or Grundgesetze of der arithmetic in 1893, the first, 1903 the second. A life's work. Hammer on chisel blows for years and years. So far, so good. But as Frege Gottlob was correcting, content, the printer's proofs already of the second volume, one cursed logic paradox, one not admitting refutation, question by Russell Bertrand, forced, without delay, the great thinker of Mecklemburg to add a last paragraph to his system, show me a great thinker who would resist the truth, accepting the reversible disaster. His foundations in ruin, his logic flawed, his work wasted, and his two volumes imagine the colossal set back, odd load and ballast for the refuge cart."

Cantor's legacy

Gottlob Frege: Let's look at the foundations! Clear ambition: Become the new Euclid. Make up a bunch of axioms for number theory. (In the case of geometry "A straight line segment can be drawn joining any two points" etc) Everything that is true in number theory can be inferred from the axioms. Writes Basic Laws of Arithmetic vol. 1. 680 pages (Amazon). About to publish vol. 2. And then.....

Disaster!!

Russell's Paradox.

- "This statement is false" Is the statement above true?
- A barber says "I shave all and only those men who do not shave themselves." Who shaves the barber??
- Self reference......

Russell's Paradox.	Changing Axioms?	Changing Axioms?
Naive Set Theory: Any definable collection is a set. Let's think about the set of all sets that don't contain themselves. Call it <i>A</i> . Does <i>A</i> contain itself? Oops! What type of object is a set that contain sets? Change Axioms!	 They did keep trying to put all of mathematics on a firm basis Trying to find a set of axioms such that is Consistent: You can't prove false statements Complete: Everything true can be proven. Other people in this story: Russell , Whitehead , Wittgenstein , Hilbert (We must know. We will know.) Until 1931. 	Kurt Gödel: Any set of axioms is either inconsistent (can prove false statements) or incomplete (true statements cannot be proven.) Concrete example: Continuum hypothesis (see official notes if interested)
 Gödelstarved himself out of fear of being poisoned Russell was finebut for two schizophrenic children Wittgenstein multiple tragedies in his family. Dangerous work? See Logicomix by Doxiadis, Papadimitriou (my advisor!), Papadatos, Di Donna. 	<text></text>	Turing

Is it actually useful?	Implementing HALT.	Halt does not exist.
 Turing: Write me a program checker! A program that checks that the compiler works! How about Check that the compiler terminates on a certain input. <i>HALT(P, I)</i> <i>P</i> - program <i>I</i> - input. Determines if <i>P(I)</i> (<i>P</i> run on <i>I</i>) halts or loops forever. Notice: Need a computer with the notion of a stored program!!!! Program is a text string. Text string can be an input to a program. Program can be an input to a program. 	HALT(P, I) P - program I - input. Determines if P(I) (P run on I) halts or loops forever. Run P on I and check! How long do you wait? Something about infinity here, maybe? Theorem: There is no program HALT.	Proof: Assume there is a program HALT(·,·). Code: import HALT; function Turing(Program P) { if (HALT(P, P:toString()) =="halts"): while(true); (go in an infinite loop) else: system.exit(); } Run Turing(Turing). Does Turing(Turing) halt? Turing(Turing) halts ⇒ then HALT(Turing, Turing.toString()) = halts ⇒ Turing(Turing) loops forever. Turing(Turing) loops forever ⇒ then HALT(Turing, Turing.toString()) ≠ halts ⇒ Turing(Turing) halts. (goes to system.exit()) Contradiction. Program HALT does not exist!
Another view of proof: diagonalization. Any program is a fixed length string. Fixed length strings are enumerable. If HALT existed, we could use it to make the following table: $ \begin{array}{c ccccccccccccccccccccccccccccccccccc$	Wow, that was easy! We should be famous!	No computers for Turing! In Turing's time. No computers. Concept of program as data wasn't really there.

Undecidable problems.

Does a program ever print "Hello World"? Find exit points and add statement: **Print** "Hello World."

Is there program that makes other programs faster?

Is there program that decides if two other programs are equivalent?

Does this computer program have any security vulnerabilities?

British Apology.

Gordon Brown. 2009. "Thousands of people have come together to demand justice for Alan Turing and recognition of the appalling way he was treated. While Turing was dealt with under the law of the time and we can't put the clock back, his treatment was of course utterly unfair and I am pleased to have the chance to say how deeply sorry I and we all are for what happened to him. Alan and the many thousands of other gay men who were convicted as he was convicted under homophobic laws were treated terribly. Over the years millions more lived in fear of conviction.

So on behalf of the British government, and all those who live freely thanks to Alan's work I am very proud to say: we're sorry, you deserved so much better."

2013. Granted Royal pardon.

More about Alan Turing.

- Brilliant codebreaker during WWII, helped break German Enigma Code (which probably shortened war by 1 year).
- Seminal paper in numerical analysis: Condition number.
- Seminal paper in mathematical biology.
- Movie:

Summary

Infinity is interesting! And mind boggling Computer Programs are an interesting thing. Like Math. Deep connection between mathematical proofs and computer programs. Computer Programs cannot completely "understand" computer programs. Example: no computer program can tell if any other computer program HALTS.

Programming is a super power.

Turing: personal.

Tragic ending...

- Arrested as a homosexual
- given choice of prison or (quackish) injections to eliminate sex drive:
- took injections.
- Iost security clearance...
- denied entry into the United States...
- suffered from depression;
- suicided with cyanide at age 42. (A bite from the apple....) accident?
